Module: Green Chemistry for Materials and Processes

Module code: W4-2BF-MB-21-06

1. Number of the ECTS credits: 6

| 2. Learning outcomes of the module | | | |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|---------------------------------|
| code | description | learning outcomes of the programme | level of competence (scale 1-5) |
| MB_06_1 | the students will have the knowledge and skills useful in designing the construction of products, materials, and plants with minimal impact on human health and the environment | KBF_K06 | 5 |
| | | KBF_U11 | 3 |
| | | KBF_W02 | 4 |

| 3. Module description | |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | The concepts that will be presented are the emerging ones of the Green Chemistry: atomic efficiency, heterogeneous catalysis and biocatalysis, replacement of solvents and toxic compounds, reaction and process intensification, conversion of biomass into valuable chemicals/materials, waste recycling, design and production of green products as bioplastics. Examples of industrial processes where this sustainability approach is adopted will be shown as the extraction of active biomolecules and biopolymers from biomass with green solvents (supercritical fluids, ionic/eutectic liquids) and enzymatic technologies, modification of natural fibers with enzymes, and green technologies (steam explosion, supercritical carbon dioxide, microwaves, etc). |
| Prerequisites | |

| 4. Assessment of the learning outcomes of the module | | | |
|-------------------------------------------------------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| code | type | description | learning outcomes of the module |
| MB_06_w_1 | exam | Oral exam | MB_06_1 |
| | | Requirement for examination: Knowledge on the tools and methodologies for the assessment of chemical, toxicological and environmental risk, life cycle analysis of products and | |

| | | | |
